PRESSURE MEASUREMENT SYSTEM FOR REFRIGERATION SYSTEM

ABSTRACT OF THE DISCLOSURE

SA

10

A pressure measuring system for a refrigeration system, such as a refrigeration system used in a commercial air conditioning system, comprises a converter

B

(42) for converting a pressure being measured into a digital signal representing the measured pressure and a

B

15

processor (54) for calculating a corresponding boiling point temperature for a selected refrigerant at the measured temperature. The system also includes a selector

for selectively inputting the boiling point temperature-pressure relationship or coefficient of a selected

B

20

refrigerant into the processor, as well as a display (60) for displaying the measured pressure and the calculated boiling point temperature.
